

Tiago Deane

Software Engineer

Information

+351 934 416 434

tiagodeane@gmail.com

Oeiras, Lisbon, Portugal

Nationalities: Portuguese, Brazilian, British

Driver's license: B

About me

Software Engineer passionate about building scalable, reliable systems, with a background in distributed systems and cloud computing. Having lived in different cultures and holding triple citizenship, I thrive in diverse, international environments, collaborating with motivated teams to create practical solutions.

Skills

- **Backend**: Python, C, Java, Node.js, gRPC, SpringBoot
- **Frontend**: JavaScript, TypeScript, CSS, HTML
- **Others**: AWS, Docker, SQL, NoSQL

Certifications

- AWS Certified Solutions Architect (Associate).
- AWS Certified Developer (Associate).
- AWS Certified Cloud Practitioner

Languages

- Portuguese (native)
- English (C2)

Work Experience

Sep 2026 - Now

Mastercard

Software Engineer I

- On the Digital Authentication Services team, a unified platform providing secure and scalable authentication across digital payments.
- Contributing to authentication capabilities such as biometrics, passkeys and 3-D Secure.

Education

2024 - Now

Instituto Superior Técnico

Master in Computer Science and Engineering

- Specializing in Software Engineering and Distributed Systems.
- **Thesis**: Triage: Automating Decision-making for Optimizing Serverless Fuctions with a Utility-driven Framework

Average grade: 16.8/20.

Master's project portfolio is available on Github.

2021 - 2024

Instituto Superior Técnico

Bachelor in Computer Science and Engineering

Average grade: 15.72/20.

Bachelor's project portfolio is available on Github.

Relevant Projects

Cloud Personal Website

Developed a serverless web application to practice AWS cloud architecture and CI/CD. The frontend is built with Astro (a JavaScript framework) and Tailwind CSS, hosted on AWS S3, and distributed globally via AWS CloudFront. A simple backend that is coded in Node.js, executed using AWS Lambda, and fronted by an API Gateway, tracks the number of visitors to the website, per country, on a DynamoDB table. CI/CD pipelines are configured using GitHub Actions to automate deployments. Backend resources are defined and managed programmatically (Infrastructure as Code) using AWS SAM.

Cloud Webserver

Developed Games@Cloud, a custom cloud orchestration system on AWS designed to execute demanding computational tasks. The webservers extract request complexity metrics and store them DynamoDB to help future scheduling decisions. A central Load Balancer and Auto-Scaler dynamically routes tasks to either EC2 or AWS Lambda based on the estimated complexity of incoming requests. This project involved building custom scaling and load balancing logic to achieve high performance while minimizing cloud expenditure.

Others

All of my projects are available on Github.
